4.7. Symmetry dictionary (symCIF)

By I. D. Brown

This is version 1.0.1 of the symmetry CIF dictionary (symCIF), which gives a more complete description of symmetry than was included in the original core CIF dictionary. A detailed commentary on the philosophy behind the dictionary and its use may be found in Chapter 3.8.

Example: 'aP' (triclinic (anorthic) primitive lattice).

[space group]

SPACE_GROUP

Contains all the data items that refer to the space group as a whole, such as its name, Laue group etc. It may be looped, for example in a list of space groups and their properties. Space-group types are identified by their number as listed in International Tables for Crystallography Volume A, or by their Schoenflies symbol. Specific settings of the space groups can be identified by their Hall symbol, by specifying their symmetry operations or generators, or by giving the transformation that relates the specific setting to the reference setting based on International Tables Volume A and stored in this dictionary. The commonly used Hermann-Mauguin symbol determines the space-group type uniquely but several different Hermann-Mauguin symbols may refer to the same space-group type. A Hermann-Mauguin symbol contains information on the choice of the basis, but not on the choice of origin.

space group.Bravais type

The symbol denoting the lattice type (Bravais type) to which the translational subgroup (vector lattice) of the space group belongs. It consists of a lower-case letter indicating the crystal system followed by an upper-case letter indicating the lattice centring. The setting-independent symbol mS replaces the setting-dependent symbols mB and mC, and the setting-independent symbol oSreplaces the setting-dependent symbols oA, oB and oC.

The data value must be one of the following:

аΡ mP mS

Affiliation: I. DAVID BROWN, Brockhouse Institute for Materials Research, McMaster University, Hamilton, Ontario, Canada L8S 4M1.

space group.IT coordinate system code A qualifier taken from the enumeration list identifying which setting in International Tables for Crystallography Volume A (2002) (IT) is used. See IT Table 4.3.2.1, Section 2.2.16, Table 2.2.16.1, Section 2.2.16.1 and Fig. 2.2.6.4. This item is not computerinterpretable and cannot be used to define the coordinate system. Use space group.transform * instead. Reference: International Tables for Crystallography (2002).

trigonal using rhombohedral axes

[space_group]

space group.IT number

_symmetry_Int_Tables_number(cif_core.dic 1.0)

The number as assigned in International Tables for Crystallography Volume A, specifying the proper affine class (i.e. the orientation-preserving affine class) of space groups (crystallographic space-group type) to which the space group belongs. This number defines the space-group type but not the coordinate system in which it is expressed.

Reference: International Tables for Crystallography (2002). Volume A, Space-group symmetry, edited by Th. Hahn, 5th ed. Dordrecht: Kluwer Academic Publishers.

The permitted range is (1, 230).

[space_group]

space group.Laue class

(char)

The Hermann-Mauguin symbol of the geometric crystal class of the point group of the space group where a centre of inversion is added if not already present.

The data value must be one of the following:

- 1 2/m mmm 4/m 4/mmm - 3 -3m 6/m 6/mmm m-3 m-3m

[space_group]

space group.Patterson name H-M

(char)

The Hermann-Mauguin symbol of the type of that centrosymmetric symmorphic space group to which the Patterson function belongs; see Table 2.2.5.1 in International Tables for Crystallography Volume A (2002). A space separates each symbol referring to different axes. Underscores may replace the spaces, but this use is discouraged. Subscripts should appear without special symbols. Bars should be given as negative signs before the number to which they apply.

Reference: International Tables for Crystallography (2002). Volume A, Space-group symmetry, edited by Th. Hahn, 5th ed., Table 2.2.5.1. Dordrecht: Kluwer Academic Publishers.

```
Examples: 'P -1', 'P 2/m', 'C 2/m', 'P m m m', 'C m m m', 'I m m m', 'F m m m',

'R -3 m', 'P -3 1 m', 'P 6/m', 'P 6/m m m', 'P m -3', 'I m -3', 'F m -3',
'P m -3 m', 'I m -3 m', 'F m -3 m'.
```

space group.centring type

Symbol for the lattice centring. This symbol may be dependent on the coordinate system chosen.

The data value must be one of the following:

```
primitive no centring
Р
           A-face centred (0, 1/2, 1/2)
Α
В
           B-face centred (1/2, 0, 1/2)
С
           C-face centred (1/2, 1/2, 0)
           all faces centred (0, 1/2, 1/2), (1/2, 0, 1/2), (1/2, 1/2, 0)
F
           body centred (1/2, 1/2, 1/2)
Т
           rhombohedral obverse centred (2/3, 1/3, 1/3), (1/3, 2/3, 2/3)
R
           rhombohedral reverse centred (1/3, 2/3, 1/3), (2/3, 1/3, 2/3)
Rrev
           hexagonal centred (2/3, 1/3, 0), (1/3, 2/3, 0)
```

[space_group]

space group.crystal system

(char)

_symmetry_cell_setting(cif_core.dic 1.0)

The name of the system of geometric crystal classes of space groups (crystal system) to which the space group belongs. Note that crystals with the hR lattice type belong to the trigonal system. The data value must be one of the following:

triclinic monoclinic orthorhombic tetragonal trigonal hexagonal cubic

[space_group]

```
* space group.id
```

(char)

This is an identifier needed if space group.* items are looped.

The following item(s) have an equivalent role in their respective categories:

```
space group symop.sg id,
_space_group_Wyckoff.sg_id.
                                                   [space_group]
```

```
space group.name H-M alt
```

(char)

_symmetry_space_group_name_H-M(cif_core.dic 1.0)

space group.name H-M alt allows for an alternative Hermann-Mauguin symbol to be given. The way in which this item is used is determined by the user and should be described in the item space group.name H-M alt description. It may, for example, be used to give one of the extended Hermann-Mauguin symbols given in Table 4.3.2.1 of International Tables for Crystallography Volume A (2002) or a full Hermann–Mauguin symbol for an unconventional setting. Each component of the space-group name is separated by a space or an underscore character. The use of a space is strongly recommended. The underscore is only retained because it was used in older CIFs. It should not be used in new CIFs. Subscripts should appear without special symbols. Bars should be given as negative signs before the numbers to which they apply. The commonly used Hermann-Mauguin symbol determines the space-group type uniquely, but a given space-group type may be described by more than one Hermann-Mauguin symbol. The spacegroup type is best described using _space_group.IT_number or space group.name Schoenflies. The Hermann-Mauguin symbol may contain information on the choice of basis but does not contain information on the choice of origin. To define the setting uniquely, use space group.name Hall, list the symmetry operations or generators, or give the transformation that relates the setting to the reference setting defined in this dictionary under _space_group.reference_setting.

[space group]

space group.name H-M full

(char)

symmetry.space_group_name_H-M(cif_mm.dic 1.0.0)

The full international Hermann–Mauguin space-group symbol as defined in Section 2.2.3 and given as the second item of the second line of each of the space-group tables of Part 7 of *International* Tables for Crystallography Volume A (2002). Each component of the space-group name is separated by a space or an underscore character. The use of a space is strongly recommended. The underscore is only retained because it was used in old CIFs. It should not be used in new CIFs. Subscripts should appear without special symbols. Bars should be given as negative signs before the numbers to which they apply. The commonly used Hermann-Mauguin symbol determines the space-group type uniquely but a given space-group type may be described by more than one Hermann–Mauguin symbol. The space-group type is best described using <code>_space_group.IT_number</code> Of <code>_space_group.name_Schoenflies</code>. The full international Hermann–Mauguin symbol contains information about the choice of basis for monoclinic and orthorhombic space groups but does not give information about the choice of origin. To define the setting uniquely use <code>_space_group.name_Hall</code>, list the symmetry operations or generators, or give the transformation relating the setting used to the reference setting defined in this dictionary under <code>space_group.reference_setting</code>.

 $Related\ items: \verb"_space_group.name_H-M_ref" (alternate),$

_space_group.name_H-M alt(alternate).

Example: 'P 21/n 21/m 21/a' (full symbol for Pnma). [space group]

space group.name H-M ref

The short international Hermann-Mauguin space-group symbol as defined in Section 2.2.3 and given as the first item of each space-group table in Part 7 of International Tables for Crystallography Volume A (2002). Each component of the spacegroup name is separated by a space or an underscore character. The use of a space is strongly recommended. The underscore is only retained because it was used in old CIFs. It should not be used in new CIFs. Subscripts should appear without special symbols. Bars should be given as negative signs before the numbers to which they apply. The short international Hermann-Mauguin symbol determines the space-group type uniquely. However, the space-group type is better described using space group.IT number Of space group.name Schoenflies. The short international Hermann-Mauguin symbol contains no information on the choice of basis or origin. To define the setting uniquely use _space_group.name_Hall, list the symmetry operations or generators, or give the transformation that relates the setting to the reference setting defined in this dictionary under _space_group.reference_setting. space group.name H-M alt may be used to give the Hermann-Mauguin symbol corresponding to the setting used. In the enumeration list below, each possible value is identified by space-group number and Schoenflies symbol.

[space group]

space group.name Hall (char)

symmetry_space_group_name_Hall(cif_core.dic 1.0)

Space-group symbol defined by Hall. space group.name Hall uniquely defines the space group and its reference to a particular coordinate system. Each component of the space-group name is separated by a space or an underscore character. The use of a space is strongly recommended. The underscore is only retained because it was used in old CIFs. It should not be used in new CIFs.

Examples: 'P 2c -2ac' (equivalent to Pca21), '-I 4bd 2ab 3' (equivalent to Ia3d).

[space group]

space_group.name_Schoenflies (char)

The Schoenflies symbol as listed in International Tables for Crystallography Volume A denoting the proper affine class (i.e. orientation-preserving affine class) of space groups (space-group type) to which the space group belongs. This symbol defines the space-group type independently of the coordinate system in which the space group is expressed. The symbol is given with a period, ', separating the Schoenflies point group and the superscript.

Reference: International Tables for Crystallography (2002). Volume A, Space-group symmetry, edited by Th. Hahn, 5th ed. Dordrecht: Kluwer Academic Publishers.

Example: 'C2h.5' (Schoenflies symbol for space group No. 14). [space group]

space group.point group H-M

(char)

The Hermann-Mauguin symbol denoting the geometric crystal class of space groups to which the space group belongs, and the geometric crystal class of point groups to which the point group of the space group belongs.

Examples: '-4', '4/m'. [space group]

space group.reference setting

(char)

The reference setting of a given space group is the setting chosen by the International Union of Crystallography as a unique setting to which other settings can be referred using the transformation matrix column pair given in _space_group.transform_Pp_abc and space group.transform Qq xyz. The settings are given in the enumeration list in the form '_space_group.IT_number: space group.name Hall'. The space-group number defines the space-group type and the Hall symbol specifies the symmetry generators referred to the reference coordinate system. The 230 reference settings chosen are identical to the settings listed in International Tables for Crystallography Volume A (2002). For the space groups where more than one setting is given in International Tables, the following choices have been made. For monoclinic space groups: unique axis b and cell choice 1. For space groups with two origins: origin choice 2 (origin at inversion centre, indicated by adding :2 to the Hermann-Mauguin symbol in the enumeration list). For rhombohedral space groups: hexagonal axes (indicated by adding :h to the Hermann–Mauguin symbol in the enumeration list). Based on the symmetry table of R. W. Grosse-Kunstleve, ETH, Zurich. The enumeration list may be extracted from the dictionary and stored as a separate CIF that can be referred to as required.

In the enumeration list below, each reference setting is identified by Schoenflies symbol and by the Hermann–Mauguin symbol, augmented by :2 or :h suffixes as described above.

[space_group]

space group.transform Pp abc

This item specifies the transformation (P, \mathbf{p}) of the basis vectors from the setting used in the CIF (a, b, c) to the reference setting given in $_{\mathtt{space_group.reference_setting}}(a', b', c')$. The value is given in Jones-Faithful notation corresponding to the rotational matrix P combined with the origin shift vector \mathbf{p} in the expression

$$(a', b', c') = (a, b, c)P + \mathbf{p}.$$

P is a post-multiplication matrix of a row (a, b, c) of column vectors. It is related to the inverse transformation (Q, \mathbf{q}) by

$$P = Q^{-1},$$

$$\mathbf{p} = Pq = -(Q^{-1})\mathbf{q}.$$

These transformations are applied as follows: atomic coordinates $(x', y', z') = Q(x, y, z) + \mathbf{q}$, Miller indices (h', k', l') = (h, k, l)P, symmetry operations $W' = (Q, \mathbf{q})W(P, \mathbf{p})$, basis vectors $(a', b', c') = (a, b, c)P + \mathbf{p}$.

This item is given as a character string involving the characters a, b and c with commas separating the expressions for the a', b' and c' vectors. The numeric values may be given as integers, fractions or real numbers. Multiplication is implicit, division must be explicit. White space within the string is optional.

Examples: '-b+c, a+c, -a+b+c' (R3:r to R3:h), 'a-1/4, b-1/4, c-1/4' (Pnnn:1 to Pnnn:2), 'b-1/2, c-1/2, a-1/2' (Bbab:1 to Ccca:2). [space group]

space group.transform Qq xyz

This item specifies the transformation (Q, \mathbf{q}) of the atomic coordinates from the setting used in the CIF [(x, y, z)] referred to the basis vectors (a, b, c) to the reference setting given in $_{\mathtt{space}}$ _group.reference_setting [(x', y', z')] referred to the basis vectors (a', b', c'). The value given in Jones-Faithful notation corresponds to the rotational matrix Q combined with the origin shift vector \mathbf{q} in the expression

$$(x', y', z') = Q(x, y, z) + \mathbf{q}.$$

Q is a pre-multiplication matrix of the column vector (x, y, z). It is related to the inverse transformation (P, \mathbf{p}) by

$$P = Q^{-1},$$

 $\mathbf{p} = P\mathbf{q} = -(Q^{-1})\mathbf{q},$

where the *P* and *Q* transformations are applied as follows: atomic coordinates $(x', y', z') = Q(x, y, z) + \mathbf{q}$, Miller indices (h', k', l') = (h, k, l)P, symmetry operations $W' = (Q, \mathbf{q})W(P, \mathbf{p})$, basis vectors $(a', b', c') = (a, b, c)P + \mathbf{p}$.

This item is given as a character string involving the characters x, y and z with commas separating the expressions for the x', y' and z' components. The numeric values may be given as integers, fractions or real numbers. Multiplication is implicit, division must be explicit. White space within the string is optional.

Examples: `-x/3+2y/3-z/3, -2x/3+y/3+z/3, x/3+y/3+z/3' (R3:r to R3:h), x+1/4, y+1/4, z+1/4' (Pnnn:1 to Pnnn:2), z+1/2, z+1/2, z+1/2 (Bab:1 to Ccca:2). [space group]

SPACE_GROUP_SYMOP

Contains information about the symmetry operations of the space group.

Category key(s): _space_group_symop.id

'c glide reflection through the plane (x,1/4,y)'

space group symop.generator xyz

(char)

A parsable string giving one of the symmetry generators of the space group in algebraic form. If W is a matrix representation of the rotational part of the generator defined by the positions and signs of x, y and z, and w is a column of translations defined by the fractions, an equivalent position x' is generated from a given position x by

$$x' = Wx + w$$
.

When a list of symmetry generators is given, it is assumed that the complete list of symmetry operations of the space group (including the identity operation) can be generated through repeated multiplication of the generators, that is, (W_3, \mathbf{w}_3) is an operation of the space group if (W_2, \mathbf{w}_2) and (W_1, \mathbf{w}_1) [where (W_1, \mathbf{w}_1) is applied first] are either operations or generators and

$$W_3 = W_2 \times W_1,$$

 $\mathbf{w}_3 = W_2 \times \mathbf{w}_1 + \mathbf{w}_2.$

Reference: *International Tables for Crystallography* (2002). Volume A, *Space-group symmetry*, edited by Th. Hahn, 5th ed. Dordrecht: Kluwer Academic Publishers.

Related item: _space_group_symop.operation_xyz (alternate). Where no value is given, the assumed value is 'x, y, z'.

Example: x, 1/2-y, 1/2+z (c glide reflection through the plane (x, 1/4, z) chosen as one of the generators of the space group). [space_group_symop]

An arbitrary identifier that uniquely labels each symmetry operation in the list.

[space_group_symop]

_space_group_symop.operation_description (char) An optional text description of a particular symmetry operation of the space group.

[space_group_symop]

A parsable string giving one of the symmetry operations of the space group in algebraic form. If W is a matrix representation of the rotational part of the symmetry operation defined by the positions and signs of x, y and z, and \mathbf{w} is a column of translations defined by the fractions, an equivalent position \mathbf{x}' is generated from a given position \mathbf{x} by

$$x' = Wx + \mathbf{w}.$$

When a list of symmetry operations is given, it is assumed that the list contains all the operations of the space group (including the identity operation) as given by the representatives of the general position in *International Tables for Crystallography* Volume A.

Reference: *International Tables for Crystallography* (2002). Volume A, *Space-group symmetry*, edited by Th. Hahn, 5th ed. Dordrecht: Kluwer Academic Publishers.

Related item: _space_group_symop.generator_xyz (alternate). Where no value is given, the assumed value is 'x.v.z'.

Example: 'x, 1/2-y, 1/2+z' (c glide reflection through the plane (x, 1/4, z)).

[space_group_symop]

space group symop.sg id

(numb)

A child of _space_group.id allowing the symmetry operation to be identified with a particular space group.

[space_group_symop]

SPACE_GROUP_WYCKOFF

Contains information about Wyckoff positions of a space group. Only one site can be given for each special position but the remainder can be generated by applying the symmetry operations stored in _space_group_symop.operation_xyz.

Category key(s): _space_group_Wyckoff.id

Example 1 – this example is taken from the space group $Fd\bar{3}c$ (No. 228, origin choice 2). For brevity only a selection of special positions are listed. The coordinates of only one site per special position can be given in this item, but the coordinates of the other sites can be generated using the symmetry operations given in the SPACE GROUP SYMOP category.

space_group_Wyckoff.coords_xyz (cha

1/4,1/4,1/4

Coordinates of one site of a Wyckoff position expressed in terms of its fractional coordinates (x, y, z) in the unit cell. To generate the coordinates of all sites of this Wyckoff position, it is necessary to multiply these coordinates by the symmetry operations stored in

_space_group_symop.operation_xyz.

Where no value is given, the assumed value is 'x, y, z'.

Example: 'x , 1/2 , 0' (coordinates of Wyckoff site with 2.. symmetry).

[space_group_Wyckoff]

* space group Wyckoff.id

(char)

cif_sym.dic

An arbitrary identifier that is unique to a particular Wyckoff position.

[space group Wyckoff]

space group Wyckoff.letter

(char)

The Wyckoff letter associated with this position, as given in *International Tables for Crystallography* Volume A. The enumeration value \setminus a corresponds to the Greek letter ' α ' used in *International Tables*.

Reference: *International Tables for Crystallography* (2002). Volume A, *Space-group symmetry*, edited by Th. Hahn, 5th ed. Dordrecht: Kluwer Academic Publishers.

The data value must be one of the following:

abcdefghijklmnopqrstuvwx yz\a [space group Wyckoff]

space group Wyckoff.multiplicity

umb)

The multiplicity of this Wyckoff position as given in *International Tables* Volume A. It is the number of equivalent sites per conventional unit cell.

Reference: *International Tables for Crystallography* (2002). Volume A, *Space-group symmetry*, edited by Th. Hahn, 5th ed. Dordrecht: Kluwer Academic Publishers.

The permitted range is $[1, \infty)$.

[space group Wyckoff]

space group Wyckoff.sg id

(char)

(char)

A child of _space_group.id allowing the Wyckoff position to be identified with a particular space group.

[space_group_Wyckoff]

space group Wyckoff.site symmetry

The subgroup of the space group that leaves the point fixed. It is isomorphic to a subgroup of the point group of the space group. The site-symmetry symbol indicates the symmetry in the symmetry direction determined by the Hermann–Mauguin symbol of the space group (see *International Tables for Crystallography* Volume A, Section 2.2.12).

Reference: *International Tables for Crystallography* (2002). Volume A, *Space-group symmetry*, edited by Th. Hahn, 5th ed. Dordrecht: Kluwer Academic Publishers.

Examples: '2.22' (position 2b in space group No. 94, $P4_22_12$), '42.2' (position 6b in space group No. 222, $Pn\bar{3}n$), '2...' (Site symmetry for the Wyckoff position 96f in space group No. 228, $Fd\bar{3}c$. The site-symmetry group is isomorphic to the point group 2 with the twofold axis along one of the 100 directions.). [space group Wyckoff]
